### **Baumann Maschinenbau Solms** **Pile turning made easy**

Baumann-Wohlenberg, the specialist for print finishing machines has manufactured the AUPASYS pile turners for years, but previously it was only available for manroland printing machines. Now, this pile turner, renamed BSW\_AUM, has been improved and can be combined with all brands.

Specially developed for the requirements of automated non-stop aggregates in the feeder of sheetfed printing and punching machines, these pile turners are available in 3B, 6 and 7 format. Their main field of application is industrial packaging printing. All processes run fully automated and

programme controlled. As they can be upgraded to inline solutions, they can also be integrated into material logistics systems. The pile turners are capable of performing a wide range of tasks – from simple

The BSW\_AUM pile turner, specifically designed for non-stop automatic sheetfed printing and stamping machines

pile turning (from thin to very thick substrates) to precise edge and centre alignment and the transfer from transport to system pallets. Sheet airing before the printing and punching process is also no problem at all.

Thanks to the innovative double clamp option, the pile can be fitted with system pallets again during turning, too. This is especially advantageous in double-sided printing or for the preparation of the piles for finishing machines (as, e.g., coating machines). Another option is the fully automated palette changing system (for system palettes). The system palette is automatically placed on the pile so that there is no need for the operator to lift, carry and align the heavy palettes.
