Automation is trump

Belgian Baumann customer Control Media now benefits from a new plate sorting machine for 100,000 plates per year and a fully-automated BASA jogging system for improved productivity and less physical strain for the operators. The company produces above all brochures, magazines and leaflets.

The BASA which is equipped with front table feeder is positioned beside the previously existing high-speed cutter of Polar-Mohr. The automated jogger can be integrated fully without any problems. Nearly 90% of the materials of different grammages processed by Control Media are now jogged by the BASA and prepared for the cutting process.

Before the decision for the automated jogger was taken, it had to be clarified whether the company would profit more from an automated cutting process or from an automated jogging process. Therefore, a comprehensive study was carried out. The result was more than clear: With an investment in an automated cutting system, the

The BASA jogging system increases productivity by up to 100%.

productivity increase was expected to be approximately 20%; with an investment in an automated jogging system, on the other hand, the productivity increase was ex-

pected to be 75%. Now the company is happy to report that the new automated jogging system helped boost productivity by 100%.
