### Cutting system now available in a light version

Baumann-Wohlenberg presented their N°2 cutting system, which offers high flexibility for medium cutting volumes, at drupa 2012 already. Now, the company has launched a cost-favourable "light version" of this system which consists of a BSH pile hoist, a BSB L (professional) jogging machine, a system for automated front table feeding (BAVB), a Wohlenberg high-speed cutter as well as a BA / BA N unloader or a BSH-W pile hoist. The system is available for format 3 (750 x 1000 mm) +.

The cutting system makes work for the operator much easier since he no longer needs to transport the pile from the jogger to the cutting machines. What is more: the BAVB can be retrofitted to any cutting machine.

A sliding gate automatically unloads the jogger and places the layers on a buffer table beside the cutting machine. A movable table with lateral stop and a sliding gate

for the transportation of jogged layers transport the layer from the buffer table to the front table of the cutting machine. The basic concept reminds of a curved gripper system (which is also available from Baumann-Wohlenberg). In contrast to the curved gripper system, the high-speed cutter of Cutting System N° 2 light is loaded from the front table. In total, the

system offers three buffers (one in the automated jogger, one on the buffer table, one in the high-speed cutter). Handling time of a job with 4-side trim is thus reduced by approx. 20 %.

Another advantage of the system is that the high-speed cutter need not necessarily be equipped with an automated chip removal device.

System N° 2 light, the "light version of Baumann's N° 2 cutting system, can be seen "life" at the cutting centre of Baumann-Wohlenberg in Solms-Niederbiehl.
