

## Successful premiere of a bagging machine

During this year's Interpack, the two business partners, Baumann Maschinenbau Solms and Hahn Automation GmbH, presented their mutually developed vertical form, fill and seal machine for the first time to a wider public. Many visitors, especially from abroad, seized the opportunity to see the PH 25 "live and in action". The visitor's reactions were very positive while the bagging machine attracted a lot of interest. As a result, many new projects

emerged already during Interpack. The vertical form-fill seal machine PH 25 is used to pack different bulk goods into tubular bags. The bulk goods are inserted via a metering unit (doser); the tubular bags are inserted directly from the film-roll. The machine is equipped with a permanent drive and characterized by a double construction, which makes it possible to process two different format sizes at the same time.

Christian Joost (r), Sales Manager at Baumann Maschinenbau Solms, and Peter Hahn, Managing Director of Hahn Automation (l), here seen with Volkmar Assmann, Managing Director of Baumann Maschinenbau Solms, were highly satisfied with the results of this début.
